

QuantumShield Technologies - Quantum Computing Research Whitepaper

Publication Date: 2026-07-01

Executive Summary

QuantumShield Technologies is researching quantum computing and post-quantum cryptography. The company is evaluating quantum-resistant algorithms for future security requirements.

Current Capability

As of July 2026, QuantumShield does not operate a quantum computer capable of breaking RSA-2048. Internal research is focused on simulation, experimentation, and migration planning for post-quantum cryptography.

Security Position

The organization recommends that customers begin crypto-inventory and migration planning. Research into quantum-resistant systems should not be interpreted as evidence that RSA-2048 has already been broken.

Conclusion

Claims that QuantumShield has already demonstrated an operational RSA-2048 breaking capability are not supported by this official publication.
